In The Claims

59. (new): A method of decontaminating a contaminated non-conducting surface, the method comprising: providing a conducting backing for the non-conducting surface; spraying photosensitizer onto the contaminated surface, the photosensitizer being electrically charged so that it is attracted to the contaminated surface; and illuminating the sprayed surface with light.

- 60. (new): The method according to claim [18] <u>59</u> wherein the light includes light of wavelengths between about 200 nm and about 320 nm.
- 61. (new): A system for decontaminating a contaminated surface, the system comprising: an apparatus for spraying a photosensitizer on the surface; a light source for illuminating the sprayed contaminated surface; and a temperature control system for heating [the] said photosensitizer with waste heat from [the] said light source.
- 62. (new—currently amended): A method for decontaminating the surface of a contaminated object, the method comprising: surrounding the contaminated object with a <u>portable</u> barrier; spraying an electrically charged photosensitizer onto the object, the photosensitizer being charged so that excess photosensitizer is attracted to and deposits upon [the] <u>said portable</u> barrier;

illuminating the sprayed surfaces of the object with light.

- 63. (new): The method according to claim [33] <u>62</u> wherein the barrier is electrically charged to attract the electrically charged photosensitizer.
- 64. (new): The method according to claim [33] <u>62</u> wherein the barrier is grounded to attract the electrically charged photosensitizer.
 - 65. (new): The method according to claim [33] 62 wherein the light includes UV light.
- 66. (new): The method according to claim [36] <u>65</u> wherein the barrier is substantially opaque to UV light.
